- 1. A field bus adapter for transmitting and receiving control data from a field bus network where data is being exchanged according to a specific field bus protocol, said adapter comprises a transmitter for transmitting data to the field bus network and a receiver for receiving data from the field bus network, characterised in that the adapter further comprises a protocol detector adapted for detecting a field bus protocol between a number of predefined field bus protocols and for setting up the receiver and the transmitter for communicating according to said detected field bus protocol, said protocol detector comprising
 - means for receiving data from the field bus,
 - means for determining if the received data complies with predefined characteristics stored in a database, said characteristics uniquely identifying data of only one of said number of predefined field bus protocols,
 - means for setting up the receiver and the transmitter for communicating according to said one protocol, if said received data complies with said characteristics.
- 2. A field bus adapter according to claim 1, wherein the protocol detector is adapted for detecting two predefined field bus protocols being a first and a second predefined field bus protocol, the protocol detector comprising
 - means for receiving data from the field bus,
 - means for determining if the received data complies with predefined characteristics stored in a database, said characteristics uniquely identifying data of said first field bus protocol,
 - means for setting up the receiver and the transmitter for communicating according to said first predefined protocol, if the received data complies with said characteristics.
- means for setting up the receiver and the transmitter for communicating according to said second predefined protocol, if said received data does not comply with said characteristics.
- 3. A field bus adapter according to claim 1-2, wherein said data are received in data frames comprising a number of fields, and wherein said

WO 03/039098 PCT/DK03/00034 17

characteristics uniquely identify data frames of one of said number of predefined field bus protocols.

- 4. A field bus adapter according to claim 3, wherein said characteristics uniquely identifying a data frame comprise characteristics of the content of 5 specific fields in the data frame.
- 5. A field bus adapter according to claim 3-4, wherein said characteristics uniquely identifying a data frame comprise characteristics of the length of a data frame. 10
 - 6. A field bus adapter according to claim 3-5, wherein the predefined protocol is detected, based on more than one data frame.
- 7. A field bus adapter according to claim 2-5, wherein the first field bus 15 protocol is Profibus and the second field bus protocol is Foundation Fieldbus.
 - 8. A field bus adapter according to claim 7, wherein the characteristics uniquely identifying a Foundation Fieldbus comprise characteristics of the content of the first field in the data frame and of the length of the data frame.

20

30

- 9. A field bus adapter according to claim 1-8, wherein the control data to be transmitted is a value representing a measured physical value.
- 10. A field bus adapter according to claim 1-9, wherein said adapter 25 comprises means for measuring said physical value.
- 11. A method of transmitting and receiving control data from a field bus network where data is being exchanged according to a specific field bus protocol, said adapter comprises a transmitter for transmitting data to the field bus network and a receiver for receiving data from the field bus network, characterised in that the adapter further comprises a protocol detector adapted for detecting a field bus protocol between a number of predefined field bus protocols and for setting up the receiver and the transmitter for communicating according to said detected field bus protocol, said method 35 comprises: ·

PCT/DK03/00034

- receiving data from the field bus,

5

- determining if the received data complies with predefined characteristics stored in a database, said characteristics uniquely identifying data of only one of said number of predefined field bus protocols,
- setting up the receiver and transmitter for communicating according to said one protocol, if said received data complies with said characteristics.
- 12. A method according to claim 11 for detecting two predefined field bus protocols being a first and a second predefined field bus protocol, the protocol detector comprising
 - receiving data from the field bus,
- determining if the received data complies with predefined characteristics stored in a database, said characteristics uniquely identifying data of said first field bus protocol,
 - setting up the receiver and transmitter for communicating according to said first predefined protocol, if the received data complies with said characteristics.
- setting up the receiver and transmitter for communicating according to said second predefined protocol, if said received data does not comply with said characteristics.
- 13. A method according to claim 11-12, wherein the step of detecting the field bus protocol and setting up the receiver and the transmitter for communicating according to the detected field bus protocol is only performed in an initialisation phase before transmitting and receiving control data via said field bus network.
- 14. A method according to claim 11-12, wherein the step of detecting the field bus protocol is performed periodically in predefined intervals.
 - 15. A storage medium having stored thereon instructions for performing the method of claim 11-14.
